

ABSTRACT

[0037] A tool comprising a holder and a retainer. The holder has: a receiving area for accepting a fastener in an insertion direction; and a notch in a sidewall transverse to the insertion direction and in communication with the receiving area. The retainer resides in the notch and extends into the receiving area. The retainer deflects away from the receiving area during insertion of the fastener and provides a bias force to the fastener to retain the fastener within the holder. The retainer has: an arcuate medial section; and a pair of arms extending from the medial section. Each arm has a bent tip. The medial section and the tips conform to the shape of the holder. Preferably, the tool is a socket wrench assembly.
